

Cable trays in Central Asia

Article Overview

Central Asia uses a variety of cable trays including ladder, perforated, solid-bottom, wire mesh, channel, and FRP trays, with materials ranging from galvanized steel to aluminum and fiberglass-reinforced plastic.

Common Structural Types

- **Ladder Cable Tray** Ladder trays consist of two side rails connected by rungs, resembling a ladder. They are ideal for heavy-duty power cables and long spans due to high load-bearing capacity and excellent heat dissipation. Commonly used in industrial facilities, power plants, and outdoor installations in Kazakhstan and Uzbekistan .
- **Perforated Cable Tray** These trays have a solid bottom with evenly spaced holes, allowing moderate ventilation while supporting cables. They are suitable for control rooms, commercial buildings, and instrumentation wiring, providing a balance between airflow and cable protection .
- **Solid-Bottom Cable Tray** Fully enclosed trays that protect cables from dust, moisture, and electromagnetic interference. They are often used in data centers, hospitals, and sensitive control systems .
- **Wire Mesh (Basket) Cable Tray** Made from welded steel wires, these trays are lightweight, flexible, and easy to modify on-site, making them ideal for IT, telecom networks, and office buildings .
- **Channel Cable Tray** A U-shaped or C-shaped tray used for small cable runs or low-voltage applications, often in industrial automation or localized installations .
- **Fiberglass-Reinforced Plastic (FRP) Cable Tray** Non-metallic trays resistant to corrosion and chemical exposure, suitable for chemical plants, water treatment facilities, and coastal areas
