

Congo OTN Router LPO

Article Overview

An OTN router in Congo enables high-capacity, transparent optical transport over DWDM networks, supporting multiple client protocols and scalable bandwidth.

What is an OTN Router?

An Optical Transport Network (OTN) router is a device that encapsulates and routes various client signals—such as Ethernet, SONET/SDH, and Fibre Channel—over a high-speed optical network using the ITU-T G.709 standard . It acts as a converged transport layer bridging legacy TDM networks and next-generation IP networks, providing transparent transport, performance monitoring, and error correction.

Key Features

- **Encapsulation and Multiplexing:** OTN routers wrap client signals into OTU (Optical Transport Unit) frames, allowing multiple lower-speed signals to be combined into high-speed optical channels .
- **DWDM Integration:** They operate over Dense Wavelength Division Multiplexing (DWDM) networks, enabling multiple wavelengths on a single fiber for efficient bandwidth utilization .
- **Flexible Switching:** Modern OTN routers, like the Apollo 9904X, support expandable switching from 700 Gbps to 2.8 Tbps per shelf, allowing flexible add/drop of services at intermediate sites .
- **Client Interfaces:** Support for 1GbE, 10GbE, 40GbE, and 100GbE, with line-side transponders capable of multiplexing multiple client signals into higher-speed ports (e.g., 4x100G into 400G),
