

Distribution boxes 220 and 380

Article Overview

Distribution boxes rated for 220V and 380V are versatile electrical enclosures designed for safe power distribution in residential, commercial, and industrial settings.

Overview

Distribution boxes, also known as DBs or electrical panels, are used to distribute electrical power safely from a main supply to various circuits. Boxes rated for 220V are typically used for single-phase systems, while 380V boxes are designed for three-phase systems, common in industrial and commercial applications . Many modern boxes support both voltages, allowing flexible deployment in mixed environments .

Key Features

- **Protection Mechanisms:** Most distribution boxes include overload, short-circuit, and leakage protection, often integrated with miniature circuit breakers (MCBs) or molded case circuit breakers (MCCBs) for enhanced safety .
- **Modular Design:** Boxes can accommodate modular components on DIN rails, enabling easy installation, maintenance, and expansion. Current ratings typically range from 6A to 250A, depending on the model .
- **Material and Durability:** Boxes are made from metal or high-quality ABS plastic, often with IP44 to IP66 ratings for dust and water resistance, suitable for indoor and outdoor use .
- **Installation Options:** Surface-mounted or flush-mounted designs are common, with adjustable guide rails and protective panels to enhance safety and convenience
