

How to replace a drop fiber optic cable

Article Overview

Replacing a fiber optic drop cable involves careful planning, selecting the correct cable type, routing, termination, and testing to ensure reliable service.

Step 1: Assess the Existing Installation

Before replacing the drop cable, inspect the current setup. Identify the distribution terminal (Fiber Access Terminal or FAT) and the subscriber's Optical Network Unit (ONU). Check for any damaged connectors, seized ports, or environmental hazards that may affect the new installation .

Step 2: Select the Appropriate Cable

Use a G.657.A2 bend-insensitive fiber for drop cables, as it handles tight bends without significant signal loss . Choose the correct jacket type:

- LSZH (Low Smoke Zero Halogen) for indoor routing
- Outdoor/Indoor rated if the cable enters a building from outside
- Figure-8 self-supporting if aerial installation is required .

Step 3: Plan the Route

Conduct a site survey to determine the optimal path from the FAT to the subscriber. Consider obstacles like HVAC ducts, steel beams, or tight corners. Leave slack loops at both ends to accommodate temperature-induced fiber movement and future maintenance
