

How to wind cables around a cable management rack

Article Overview

Properly winding cables around a cable management rack involves using horizontal and vertical managers, maintaining bend radii, grouping by type, and securing with reusable Velcro straps for organized, accessible, and safe installations.

Step-by-Step Guide

1. Plan Your Cable Routes Before winding, measure the rack dimensions and determine the path each cable will take. Reserve the left side for power cables and the right for network cables to reduce interference and simplify troubleshooting. Identify horizontal and vertical cable managers for routing cables between devices and along the rack sides .
2. Use Horizontal Cable Managers Install 1U or 2U horizontal cable managers between equipment groups. These provide organized pathways for patch cords, prevent sagging, and maintain proper bend radius. Run cables across the rear of the rack and through these managers to keep them grouped by function .
3. Use Vertical Cable Managers Vertical managers, typically 22RU or 44RU, mount on the sides of the rack. They allow cables to run the full height of the rack, reducing tangles and preventing cables from rubbing against sharp edges. Choose units that allow front or back access for easier maintenance .
4. Maintain Proper Bend Radius and Service Loops Avoid sharp bends that can damage cables. Leave a small service loop at each connection point to allow for future adjustments or replacements without tensioning the cable .
5. Secure Cables with Reusable Fasteners Use Velcro straps instead of zip ties. Velcro allows easy modifications, prevents cable damage, and keeps bundles neat. Group cables by type and functio...
