

Indoor cable laying in conduit

Article Overview

Indoor cable installation in conduit protects wires, facilitates future upgrades, and ensures compliance with safety codes.

Choosing the Right Conduit

For indoor installations, common conduit types include Electrical Metallic Tubing (EMT), Rigid PVC, and Flexible Metal Conduit (FMC). EMT is lightweight, easy to bend, and ideal for dry wall cavities, while PVC is corrosion-resistant and suitable for areas with moisture. FMC is flexible, making it useful for short, complex runs or connections to fixtures in tight spaces .

Planning and Layout

- Trace the route from the power source or distribution panel to outlets, switches, or junction boxes.
- Mark bends and offsets to ensure smooth transitions and avoid sharp angles that can damage cables .
- Limit conduit runs to manageable lengths; for fiber or sensitive cables, avoid more than 100 feet between pull points and restrict bends to no more than two 90-degree angles .

Installation Best Practices

- Deburr conduit ends after cutting to prevent cable insulation damage.
- Use pull cords or fish tapes to guide cables through the conduit efficiently
