

Mesh cable tray cable holder cable entering the cabinet

Article Overview

Cables from a mesh cable tray should enter the cabinet through a secured, protected exit using support brackets, edge protection, and proper bundling to ensure safety and organization.

Planning and Preparation

Before routing cables into a cabinet, plan the tray route carefully using CAD or BIM models to mark bends, risers, and exit points. Calculate the total cable load to select the appropriate tray width and support spacing, typically 1.5-2.5 meters for mesh trays, ensuring the tray can handle 1.5 times the actual load for safety .

Support and Mounting

To guide cables into a cabinet, the mesh tray must be properly supported:

- Direct Cabinet Mounting: Use an FASP support bolted directly to the cabinet for a low-profile entry .
- Elevated Entry: If the tray needs to be raised above the cabinet, use a UFS support bracket or an FASP elevated with threaded rods .
- Ensure the tray is level and securely fastened to prevent sagging or movement.
