

Optical module s received optical power

Overview

Received optical power refers to the range of average optical power that the receiver component of the optical module can receive under a certain bit error rate (BER=10⁻¹²) condition., The single-mode optical module has a receiving power range of -23 dBm. Run the display interface interface-type interface-number transceiver verbose command to check whether the receive optical power and transmit optical power are normal. Diagnostic information: Temperature (Celsius) :33. 97 Bias High Threshold (mA). TX/RX power, in the context of networking and optical transceivers like SFP modules, refers to transmit (TX) and receive (RX) power levels.
