

Smart PDU Default IP

Article Overview

Smart PDUs typically come with a default IP address or require a network reset to restore factory IP settings, which is documented in the user manual.

Default IP Address

Most Smart PDUs are shipped with a factory default IP address that allows initial access to the web interface. The exact default IP can vary by manufacturer and model. For example, the SP7040200 PDU requires you to enter the default username and password to log in, after which you can configure the IP address via the dashboard (the manual does not specify a fixed default IP, implying it may be DHCP-assigned or documented in the included manual) . Other models, like Vertiv rPDUs, allow a network reset by holding a button for 10 seconds, which restores the default IP and user account information .

Accessing the PDU

- Connect to the network: Use a wired Ethernet connection for stability during setup .
- Login credentials: Locate the default username and password in the PDU's user manual .
- Web interface: Access the PDU via a web browser using the default IP or after performing a network reset .
- Network configuration: Once logged in, you can assign a static IP or configure DHCP, set SNMP parameters, and update firmware for security and functionality .
