

What are the uses of low-speed optical modules

Overview

LPO modules are built for short-reach, high-density connections where efficiency and low latency matter most. In AI/ML clusters and GPU fabrics, removing DSP delays improves synchronization during training, while reduced power and cost per link make it easier to scale massive. Typically, modules with a transmission rate of 1 Gbps or lower are classified as low-speed optical modules. Categories Currently, low-speed optical modules mainly come in two form factors: GBIC and SFP, which differ in size, physical design, and practical application. GBIC Optical Module: GBIC. Modern communication networks rely on optical transceivers to transfer data at the speed of light. Think of it. As global networks push toward faster, more energy-efficient transmission, technologies like DSP [Digital Signal Processing], LPO [Low Power Optimization], and LRO [Long Reach Optimization] are playing increasingly important roles in optical communication. These compact pluggable units convert electrical data into light signals for transmission over fiber optic cables.
