

Which type of indoor cable tray should you choose

Article Overview

For indoor applications, perforated, wire mesh (basket), and solid-bottom cable trays are generally the best choices, depending on cable type, protection needs, and ventilation requirements.

Perforated Cable Trays

Perforated trays feature a solid base with evenly spaced holes, providing moderate ventilation and strong cable support. They are ideal for mixed cable types, including power and data cables, in office buildings, commercial facilities, and control rooms. The perforations help prevent overheating while maintaining a neat and organized layout, making them a versatile choice for most indoor environments .

Wire Mesh (Basket) Cable Trays

Wire mesh trays are lightweight, flexible, and easy to modify, making them perfect for low-voltage, data, and fiber optic cables. Their open-grid design allows excellent airflow and quick installation, which is especially useful in IT rooms, data centers, and office networks where frequent changes or expansions are expected .

Solid-Bottom Cable Trays

Solid-bottom trays provide maximum protection by fully enclosing cables, shielding them from dust, moisture, and electromagnetic interference. They are suitable for s...
