

Wiring connectors for distribution cabinets

Article Overview

Wiring connectors in distribution cabinets ensure safe, modular, and efficient electrical connections for power, control, and signal circuits.

Types of Connectors

Terminal Blocks: Terminal blocks are widely used for connecting wires within distribution cabinets. They allow secure, organized connections for both solid and stranded conductors. Modern push-in or screw-type terminal blocks, such as WAGO's TOPJOB® S series, provide reliable connections and support a wide range of wire cross-sections, making them suitable for building and industrial applications .

Industrial Connectors: Circular Plastic Connectors (CPC), Heavy Duty Connectors (HDC), and M8/M12 connectors are used for power, signal, and data transmission. These connectors are rugged, often IP65-IP69K rated, and designed for harsh industrial environments, ensuring reliable communication and power delivery .

Cable Glands and Feed-Throughs: Cable glands provide strain relief and environmental protection for cables entering the cabinet. They maintain IP ratings and prevent dust or moisture ingress, while structured cable entry systems allow orderly routing of multiple cables .

Service Interfaces and Sockets: RJ45, USB, and D-SUB connectors facilitate maintenance, diagnostics, and device connectivity directly within the cabinet. These interfaces reduce the need for external connections and simplify servicing .
